Please note: International students must have a F1 visa in order to enrol at OSU. Non-international students are accepted on an enrollment-by-enrollment basis, please check with the International Office before you make your travel plans. One way to gain an appreciation for public health is to learn the history of an important disease. For example, by studying the history of smallpox, we can better appreciate how these diseases came to be. Smallpox, also called variola, is the only disease that has ever been completely eradicated. What makes this disease important? Read on to find out how its history informs the prevention of this disease today.

**Background and transmission** In the last century, smallpox infection was responsible for more deaths in history than any other infectious disease. With more than 30 million deaths, it was responsible for the highest rates of death and disability than any other infectious disease. It was also responsible for the highest rates of infection.<sup>1</sup> To understand this disease, it is important to understand how the virus is transmitted. In the early 20th century, people were routinely infected from close contact with an active infection. For example, in 1921, an outbreak of smallpox at a New York City daycare center infected 8 children. Two of the 8 children later died from the infection. As there were no effective treatments for smallpox, this outbreak continued to expand. In the early 1920s, doctors working in the Ukraine estimated that 1 in 10 people living in the area had smallpox. This number increased

---

when 30% of the villages in the region were infected by the end of the 1920s. The highest rate of smallpox infection was in the tropics, where 10 to 15% of the population was infected every year.<sup>2</sup> In industrialized countries, the rate of infection was much lower. This decreased because effective treatments were developed in the late 19th century.<sup>1</sup> It was in this era that vaccination began. The first vaccine was developed in the late 1800s. The smallpox vaccine was effective in reducing the infection rate. The vaccine was not as effective in the early 20th century as it is today. Many people in the early 20th century did not receive the smallpox vaccine. Also, in the early 1900s, the smallpox vaccine was not available in all areas of the country. The US Public Health Service began to actively advocate for and later endorsed vaccination for all children at an early age. In the early 20th century, smallpox infection was a major cause of death in children
